Foreword

The 1980-81 edition of the *Source Book of Health Insurance Data* is a statistical report of the private health insurance business in the United States. It is published by the Health Insurance Institute on behalf of companies that provide health insurance to the American public.

This 22nd edition of the *Source Book* provides the latest available data on major forms of health insurance: hospital, surgical, physician's expense, major medical, disability and dental insurance. Also included is information on medical care costs, morbidity and health manpower in the United States. The data have been compiled from reports of insurance companies and other health insurance plans, government agencies and hospital and medical associations.

The *Source Book* is used as a reference by writers, editors researchers, educators, government leaders, hospital and medical professionals, business associations and unions, and others interested in health care and its financing.

*Data for "Insurance companies" refer to earned premiums. Data for "Blue Cross-Blue Shield and other hospital-medical plans" refer to earned income.

†Preliminary estimate.

NOTE: Some data are revised from previous years. The 1976 and later data include the number of persons protected, benefit payments and premiums of persons in Puerto Rico and other U.S. territories and possessions.

SOURCES: Health Insurance Association of America, Health Insurance Institute, Blue Cross Association, Blue Shield Association, American Hospital Association and U.S. Department of Health and Human Services.

CHAPTER 1
Extent of Private Health Insurance Coverage

At the end of 1979, more than 183 million Americans — 85% of the civilian noninstitutional population — were protected by one or more forms of private health insurance (Table 1.1).

These included some 169 million persons under 65 — representing nearly nine of 10 in this age group. An additional 14 million older persons — six of 10 in the 65-and-older population — held private health insurance policies to supplement benefits available through Medicare.

Various forms of private health insurance coverage are available from several different types of insurers: insurance companies, hospital and medical service plans like Blue Cross and Blue Shield, group medical plans operating on a prepayment basis such as Health Maintenance Organizations, and others.

Over 1,200 private insurance companies in the United States were writing individual and/or group health insurance covering more than 104 million persons at year-end 1979. Policies issued by insurance companies provide for payment directly to the insured or, if assigned by the insured, to the provider of services for reimbursement of expenses incurred. Health insurance coverage made available by insurance companies can be divided into two basic categories — *medical expense* insurance and *disability income* insurance. *Medical expense* insurance is a "reimbursement type" of coverage which provides broad benefits that can cover virtually all expenses connected with hospital and medical care and related services. *Disability income* insurance provides periodic payments when the insured is unable to work as a result of sickness or injury.

The Blue Cross Association and the Blue Shield Association are coordinating bodies for the nation's Blue Cross and Blue Shield plans. The nonprofit member plans service statewide and other geographical areas, offering both individual and group coverage.

Blue Cross plans provide hospital care benefits on essentially a "service type" basis, under which the organization, through a separate contract with member hospitals, reimburses the hospital for covered services rendered to the insured.

Blue Shield plans provide benefits for surgical and medical services performed by a physician. The typical Blue Shield plan provides benefits similar to those provided under the benefit provisions of hospital-surgical policies issued by insurance companies. At the end of 1979, there were 68 Blue Cross plans and 67 Blue Shield plans in the United States. Of these, 26 were joint plans, making a total of 112 Blue Cross and Blue Shield plans.

Health care coverage is also provided through Health Maintenance Organizations (HMOs), which provide comprehensive health care services for their members for a fixed periodic payment. In such plans a group of physicians, surgeons, dentists or optometrists furnish needed care as specified in the contract to subscribers. From 1971 to mid-

1980, the number of operational HMOs increased from 33 to 236, and the number of subscribers increased from 3.6 million to 9.2 million.

Certain types of health insurance coverage are also made available by plans that are administered by employers or labor unions, fraternal societies, communities, or by rural and consumer health cooperatives. Usually the protection provided by these groups is the amount desired and affordable by a specific group of people.

It is estimated that some 20% of the total 1979 insurance company group coverage is represented by Administrative Service Only (ASO) arrangements and Minimum Premium Plans (MPPs). Under these systems, corporations and other organizations can establish self-funded health plans. Insurance carriers or private organizations are paid a fee by the self-funding group to process the claims and benefits paperwork and insure against a certain level of large, unpredictable claims. These types of arrangements represented approximately 18% of total insurance company group coverage in 1978 and less than 5% prior to 1975.

Hospital Expense Insurance

At the end of 1979, more than 183 million persons were covered by hospital expense insurance (Table 1.2). This type of coverage has grown 18% since 1969.

Hospital expense insurance provides specific benefits for daily hospital room and board and usual hospital services and supplies during hospital confinement. The maximum benefit for miscellaneous expenses is frequently a specified dollar amount which may be expressed as a multiple of the daily room and board benefit.

Room and board benefits are usually stated in one of two ways. One is reimbursement for the actual room and board charge up to a specified maximum amount per day for hospital confinement. The second provides a service-type benefit which equals the semiprivate room and board charge of the hospital.

Generally, hospital expense insurance is sold in combination with surgical expense insurance so as to provide benefits for both surgical operations and in-hospital doctor's visits. In such cases the policy is referred to as a Hospital and Surgical Expense policy.

Persons covered for hospital expense by insurance companies include those who have only hospital indemnity coverage. This type of coverage, issued on an individual basis, provides a stipulated daily, weekly or monthly indemnity during hospital confinement. The money is payable on an unallocated basis without regard to the actual expense of hospital confinement and is generally considered to be more closely related to disability income insurance than hospital or medical expense insurance.

At year-end 1979, 6.4 million persons over age 65 were protected by hospital coverage issued through insurance companies. This figure included 3.4 million with hospital indemnity coverage and 3.0 million with supplemental coverage for Medicare Part A. At the same time, 1.8 million persons over age 65 had coverage through insurance companies to supplement Medicare Part B (surgical/medical).

Hospital Indemnity	3,418
Medicare Part A — hospital copayment coverage	2,964
	6,382
Medicare Part B — surgical copayment coverage	1,751
Prescribed Drugs and Medicines	998
Nursing Home Care	1,373
Private Duty Nurse	1,030

Surgical Expense Insurance

At the end of 1979, nearly 174 million persons had protection against the costs of surgery (Table 1.3), an 18% growth since 1969.

This coverage provides benefits for the cost of surgical procedures performed as a result of an accident or sickness. Payment toward the charges for administration of an anesthetic for a covered surgical procedure is also often included. Benefits under this form of insurance might be paid according to a schedule of surgical procedures, with the policy listing the maximum benefit for each type of operation covered. An increasing number of insurance plans offer surgical benefits for the physician's fee up to the "reasonable and customary" charge for the procedure performed. No separate surgical schedules are included in this type of policy.

Physician's Expense Insurance

At year-end 1979, nearly 164 million persons (Table 1.4) had physician's expense coverage (formerly termed Regular Medical Expense Insurance). This form of health insurance provides benefits to help pay a physician's fees for nonsurgical care in a hospital, home or doctor's office. There are usually maximum benefits for specific services that sometimes include diagnostic X-ray and laboratory expenses.

Major Medical Expense Insurance

Major medical expense insurance — introduced nationally by insurance companies in 1951 — has grown rapidly. By the end of 1979, 148 million persons had major medical coverage through insurance company policies, Blue Cross-Blue Shield, HMOs and other independent plans (Table 1.5). Insurance companies alone covered more than 104 million persons (Table 1.6).

Major medical coverage provides broad and substantial protection for large, unpredictable medical expenses. It covers a wide range of medical charges with few internal limits and a high overall maximum benefit. Basically, there are two types of major medical plans: one supplements basic hospital-surgical-physician's expense insurance programs; the other provides comprehensive protection where both basic coverage and extended health care benefits are integrated.

Maximum benefits range from $10,000 per person to, in some cases, unlimited benefits. A survey of new group major medical benefits revealed that of those plans issued by insurance companies in 1980, 93% of surveyed employees had maximum benefits of more than $100,000 compared with 71% in 1975. Of those with maximum benefits of more than $100,000, 57% had maximums of $1 million and over, and 29% had unlimited benefits.

Normally, insurance company and

medical plan benefits are subject to some form of deductible and coinsurance payments by the insured.

Disability Income Protection

Disability income benefits in accident and health policies provide for the partial replacement of income lost by employed men and women as a result of accident or illness. The amount of the benefit may vary, depending upon (1) whether the disability is total or partial and (2) the duration for which benefits are payable, which usually varies, depending upon whether the loss of income is the result of an accident or illness. There are two basic types of disability income coverage, short-term and long-term. Short-term policies provide benefits for up to two years; long-term plans provide benefits for durations such as five years, ten years or to age 65.

At the end of 1979, 84 million persons had some form of disability income coverage. This amounts to nearly nine in 10 civilian workers. Some 66 million persons in the United States were covered by short-term protection through insurance company plans or other formal arrangements, and 20 million persons were covered by long-term policies of insurance companies. More than 2 million persons covered by long-term plans also had short-term coverage. The apparent drop in short-term disability income coverage between 1978 and 1979 reported in Table 1.9 is because of the increase in the number of employers choosing Administrative Service Only arrangements or Minimum Premium Plans over fully-insured coverage. Such arrangements are not included in the data reported in Table 1.9.

Dental Expense Insurance

Dental expense insurance provides reimbursement for expenses of dental services and supplies and encourages preventive care. The coverage normally provides for oral examinations (including X-rays and cleanings), fillings, extractions, inlays, bridgework and dentures, as well as oral surgery, root canal therapy and orthodontics.

Dental coverage is generally available through insurance company group plans, prepayment plans and dental service corporations.

It is estimated that over 70 million persons were protected by some form of dental expense insurance at year-end 1979 (Table 1.10).

The largest providers of this type of protection are insurance companies, which insured 43.4 million persons through group policies at the end of 1979, compared to 16.8 million in 1974.

Blue Cross-Blue Shield plans, which first offered dental coverage in the late 1960s, covered over 8 million persons at the end of 1979. An additional 19 million persons were covered by dental service corporations, HMOs or through union self-insurance trusts in which union welfare funds directly reimburse dentists in group practice clinics.

Characteristics of Insureds

A study by the National Center for Health Statistics focuses on the demographic and health characteristics of persons covered by private health insurance in 1975. The report contrasts the characteristics of those persons covered by the two major types of private health insurance, namely fee-for-service plans and prepaid group plans, such as HMOs.

Membership patterns of the two types of coverage were found to be similar by age and sex. However, there were wide variations in race, geographic region, education of the family head and family income. Prepaid group membership was proportionately higher among blacks, within central cities, in the Northeast and the West. Membership in these types of plans was also substantially higher among families where the family head had a higher education level and among families in higher income brackets.

Persons covered by prepaid group plans tended to make more doctor visits per year on the average than those covered by fee-for-service type plans—5.9 visits to 5.0 visits, respectively (Table 1.11). However, those covered by fee-for-service plans had a higher hospital utilization rate, 13.7 versus 11.2 discharges per 100 covered persons, and a higher average length of stay in short-stay hospitals, 7.5 days versus 6.6 days.

The Uninsured Population

Estimates of the number of persons in the United States without private or public protection against health care expenses have been developed by private and governmental agencies.

The purpose of this section is to summarize various studies. No attempt has been made to analyze the accuracy of the findings due to differences in definitions, methodology and time periods covered.

The Social Security Administration estimates that in 1976, some 24 to 25 million persons (12% to 13% of the U.S. population under age 65) have no public or private protection against the cost of hospital or surgical care.[1]

A study conducted by The Robert Wood Johnson Foundation concurs with the Social Security Administration's estimate.[2]

Based on estimates from 1974 and 1975, a study conducted by Pracon, Inc., for Roche Laboratories concludes that only 6% of the total population, some 12.2 million persons, have no private or public health insurance coverage.[3]

A study conducted during the first four months of 1977 by the National Center for Health Services Research concludes that 12.6% of the population, or 26.6 million persons, had no health insurance at that time.[4]

The Congressional Budget Office's most recent report on the uninsured population concludes that from 11 to 18 million persons (some 5% to 8% of the population) were without health care coverage in 1978. According to their findings, young adults are almost twice as likely as any other age group to be without coverage and, although they account for only 11% of the population, they represent over 20% of the uncovered population. Among employed persons, those earning less than $10,000 are most likely to be without coverage, accounting for 55% of the unprotected population.[5]

*The data refer to the net total of people protected, i.e., duplication among persons protected by more than one kind of insuring organization or more than one insurance company policy providing the same type of coverage has been eliminated. The estimated distribution by states essentially reflects coverage by employment rather than residence with adjustment to take into account the population of the states.

†Preliminary estimate.

NOTE: For 1975 and later, data include the number of persons covered in Puerto Rico and other U.S. territories and possessions. Data in the category "Insurance companies" refers to the net total of people protected, i.e., duplication among persons who are covered by both group and individual policies has been eliminated. Any duplication resulting from the combination of numbers covered for short-term and long-term protection has not been eliminated. This category excludes Administrative Service Only Agreements and Minimum Premium Plans except for those companies who include them in their regular reporting. The cateogry "Formal paid sick leave plans" refers to people with formal paid sick leave plans but without insurance company coverage. The category "Other" includes union-administered plans and the Federal Mutual Benefit Association.

SOURCES: Health Insurance Association of America and U.S. Department of Health and Human Services.

CHAPTER 2
Health Insurance Benefit Payments

A total of $57.3 billion in health insurance benefits was paid by private insuring organizations in the United States in 1979 (Table 2.1), a 12.8% increase over 1978 and more than four times the amount paid 10 years earlier. The increase was mainly because of the rising cost of medical care, expansion of benefits and higher utilization.

Medical expense benefits, which include payments under hospital, surgical, physician's expense and major medical insurance, totaled $49.9 billion in 1979, an increase of 11.2% over 1978. Of this amount, $23.0 billion was paid by insurance companies and nearly $26.9 billion was paid by Blue Cross-Blue Shield and other hospital-medical plans. Dental expense benefits for 1979 totaled $2.8 billion.

Health insurance benefits are provided by private insurers in two ways: through indemnity payments or through service arrangements.

Benefits by insurance companies are primarily provided through indemnity payments, whereby the insured person is paid a specified sum of money toward his covered expenses. (Payments can also be made directly to the provider of care through an assignment of benefits.)

Blue Cross-Blue Shield and other hospital-medical plans usually make direct payments for covered services to the participating hospital or physician.

The state in which the largest amount of benefit payments was made in 1979 was California. New York ranked second, followed by Michigan, Pennsylvania and Ohio (Table 2.3). Persons in these five states received 37% of all health insurance benefits paid in 1979, and they represented 33% of the population of the United States.

The numbers in this chapter refer to benefits paid in the current year and include amounts paid for claims of prior years. However, they exclude amounts which will be paid the following year for claims submitted in the current year. Since the premium figures in the next chapter are reported on an earned basis for the calendar year, thereby reflecting a true picture of premiums for the year, it is not appropriate to compare benefit and premium figures.

A comparison of the benefit and premium figures for loss of income policies is particularly inappropriate. Additions to claim reserves for persons already disabled are extracted from current year premiums but not reflected in the benefit payments. These claim reserves will be used to make income payments for all future years of disability included in coverage under the contracts.

CHAPTER 3
Health Insurance Premium Income

In 1979, health insurance premium income of all private insuring organizations amounted to $66.1 billion. Americans spent the equivalent of 4.07% of disposable personal income (personal income less personal taxes) in 1979 for health insurance premiums, compared with 4.12% in 1978 (Table 3.1).

Insurance company premiums reported in Tables 3.1, 3.2 and 3.3 are on an earned basis for the calendar year. (Earned premiums are defined as the calendar-year portion of premiums for which the protection of the policy has been provided.)

Because benefit data in the preceding chapter refer to paid benefits and do not include estimates for reserve and liability items, it is inappropriate to compare those benefit data to premium data in this chapter.

Insurance companies earned $35.8 billion in premiums in 1979. The premiums or "subscriptions" received by Blue Cross-Blue Shield organizations and other hospital-medical plans are also reported on a calendar-year basis and amounted to $30.3 billion in 1979.

The largest amount of health insurance premiums paid to private insuring organizations in 1979 came from persons in California (Table 3.3). The second and third largest amounts came from persons in New York and Michigan, respectively.

Group and Individual Premiums

Group health insurance premiums paid to private insuring organizations have been increasing substantially for many years. This growth is attributed to the expansion of hospital, surgical and physician's expense protection for employees; to the extension of health insurance coverage to small groups not previously eligible; and to the need to fund larger benefit levels to meet health care cost increases. In 1979, insurance companies earned $29.6 billion in group premiums—some 83% of total insurance premiums—and $6.2 billion in individual and family policy premiums.

CHAPTER 4
Federal, State and Local Government Health Care Programs

Medical and health care services are provided through a variety of public programs by all levels of government. In addition, the Federal, state and local government agencies often fund research projects and construct medical facilities with public funds. Of the $212.2 billion dollars in national health care expenditures in 1979 (see Chapter 5), $91.4 billion was spent for health and medical care programs at all levels of government (Table 4.1).

As the number of programs funded by public monies has multiplied and expanded, so, too, has the public share of national health expenditures. In fiscal 1969, governmental expenditures for health care were 37.8% of national health expenditures, compared to 43.1% in 1979. The introduction of Medicare produced the largest single-year increase in 1967, during which governmental expenditures rose from 25.7% to 33.1% of national health expenditures.

Federal Programs

Prior to 1967, state and local expenditures for health care exceeded Federal expenditures; Federal health expenditures accounted for less than 5% of Federal spending. In 1979, Federal expenditures for health care were double state and local expenditures and accounted for nearly 13% of Federal spending (Table 4.2).

The majority of Federal health spending is for health services to six major groups: low-income individuals and others eligible for Medicaid services, those over 65 (Medicare), military personnel and their dependents, veterans, Federal civilian employees, and native Americans. In 1979, Federal budget outlays for health care facilities and services for these groups were 86% of Federal health spending.

Medicaid. Title XIX of the Social Security Act provides for a program of medical assistance for certain low-income individuals and families. The program, known as Medicaid, became Federal law in 1965.

Medicaid is basically administered by each state within certain broad Federal requirements and guidelines. The program is financed jointly by state and Federal funds and is designed to provide medical assistance to those groups or categories of persons who are eligible to receive payment under one of the cash assistance programs, (i.e., Aid to Families with Dependent Children and Supplemental Security Income). In addition, states may provide Medicaid to the "medically needy," that is, to persons who fit into one of the categories eligible for public assistance, who have enough income to pay for their basic living expenses but not enough to pay for their medical care. As of January 1979, thirty-one states, plus Guam, Puerto Rico and the Virgin Islands granted Medicaid eligibility to their "medically needy" populations.

Many members of the Medicaid population are aged or disabled and are also covered by Medicare. In

cases where this dual coverage exists, most state Medicaid programs pay for the Medicare premiums, deductibles and copayments, and for services not covered by Medicare.

In order to qualify for Federal matching funds, state programs must include: inpatient hospital services; outpatient hospital services; laboratory and X-ray services; skilled nursing and home health services for individuals 21 and older; family planning services; early and periodic screening, diagnosis and treatment for children under 21; and physicians' services at home, in the office, hospital, nursing home or elsewhere.

In fiscal 1979, the Medicaid program paid $20.0 billion in benefits and averaged 8.5 million recipients per month (Table 4.3).

State participation in the Medicaid program is optional. Currently, all states except Arizona have Medicaid programs. The District of Columbia, Guam, Puerto Rico, and the Virgin Islands also provide Medicaid coverage.

Medicare. Medicare, which became effective July 1, 1966, is a Federally administered program that provided hospital and medical insurance protection for nearly 28 million persons in 1979 — those 65 and older, persons under age 65 who have been receiving cash benefits under the Social Security or Railroad Retirement programs because they are disabled, and certain chronic kidney disease patients under age 65. Medicare consists of two parts: compulsory hospitalization insurance (HI), also called Part A; and voluntary supplementary medical insurance (SMI), Part B, which helps pay for physicians' services and some medical services and supplies not covered under Part A. Part A is financed by contributions from employers and employees; Part B is voluntary and is financed by monthly premiums paid by those who choose to enroll and by the Federal government.

As of January 1, 1981, the out-of-pocket deductible for Part A of Medicare rose to $204 (from $180) for the first 60 days' hospitalization and $51 per day (from $45) for the 61st through the 90th day.

Part B provides benefits equal to 80% of covered medical-surgical charges after the insured has paid a $60 deductible amount toward those charges. An individual's monthly premium is $9.60 ($11.00 on July 1, 1981).

Prior to 1973, aliens and some Federal civil service employees and annuitants were not eligible for Part A of Medicare even though they were 65 or older. In 1973, the law was amended to allow them to enroll in Part A by paying a monthly premium. The premium is high, $78 a month ($89 on July 1, 1981), since it is based on the full cost of hospital care for a high-risk group. These individuals have always had the option of enrolling in Part B.

Since the first full year of Medicare in 1967, benefits paid have increased from $4.5 billion to over $29.3 billion in 1979, an increase of 545% (Table 4.4). Part of the increase is because of the eligibility of certain disabled persons beginning in 1973, so that in 1979 nearly 14% of total benefits paid went to individuals under age 65. Benefits paid under Part A totaled $20.6 billion in 1979, of which $18.1 billion went to those age 65 and older. Part B paid $8.7 billion, of which $7.3 billion went to the elderly.

Insurance companies, Blue Cross-Blue Shield plans and other independent organizations participate as fiscal intermediaries for the govern-

ment. In 1979, five private health insurance companies served as fiscal intermediaries for Part A of Medicare and 12 companies for Part B (Table 4.6).

Military Personnel and Dependents. All active and retired military personnel and their dependents are eligible for medical treatment at any Department of Defense (DOD) installation medical facility. Additionally, DOD operates the Civilian Health and Medical Program of the Uniformed Services (CHAMPUS) to provide reimbursement (after payment of a deductible) for covered medical care rendered in civilian facilities to wives and children of active military personnel, retired military personnel and their dependents, and dependents of deceased personnel (unless eligible for Part A of Medicare). The program is designed for those unable to use government medical facilities because of distance, overcrowded facilities or the unavailability of appropriate treatment at a military medical center.

Of the $3.4 billion spent on medical care by the Department of Defense in fiscal 1978, $527 million was for medical services rendered under CHAMPUS.

Federal Civilian Employees. Civilian employees of the Federal government may participate in a variety of insurance programs (including HMOs) through the payment of biweekly premiums by the employing agency and the employee. Nearly 3.5 million Federal civilian employees and annuitants were enrolled in 1979, and more than 6.5 million dependents were also insured in that year. Most annuitants who were covered under the Federal Employees Health Benefits Program when they were employed by the Federal government may elect to continue this coverage. Annuitants not previously insured under the program may participate in the Retired Federal Employees Health Benefits Program, which, among other options, provides for government payment of the premium for Medicare Part B. Of the 102,193 retirees enrolled in this program on June 30, 1979, 41% had chosen the Medicare Part B option. The remainder were covered under private plans.

In addition to Federal payment of the employer contributions under these programs, the Federal government also incurs administrative expenses and operates in some Federal agencies' in-plant health care facilities for Federal civilian employees.

Federal expenditures for these Federal civilian health programs in fiscal 1979 were nearly $2.0 billion.

Veterans Medical Care. The Veterans Administration (VA) operates 172 medical centers and 49 independent or satellite clinics for the care of individuals with active service in the armed forces who were discharged from duty other than dishonorably. Priority is given to patients with service-related ailments. Of the $5.5 billion budgeted by the Federal government for VA medical services in 1979, $5.3 billion was for medical care and hospital services.

Inpatient care was provided to some 1.3 million veterans in 1979.

Indian Health Services. A total of $555 million in Federal funds was spent to provide health services to more than 734,000 American Indians and Alaskan natives in 1979. The services included hospital care and other medical services; the construction of hospitals, sanitation facilities and housing for health

service employees; health manpower training and education; health planning; and research.

Workers' Compensation Medical Care. The Federal government in calendar 1979 paid $108 million of the over $3.3 billion in hospital and medical benefits and administrative expenses under Workers' Compensation laws in the various states (Table 4.7). Hospital and medical costs amounted to about one-third of all Workers' Compensation expenditures.

State and Local Programs

The nation's 57 official State Health Agencies (SHAs) spent an estimated $3.5 billion in fiscal 1979, including $1.3 billion of Federal funds (Table 4.8). These figures do not include Medicaid expenditures or funds expended for public health purposes by other state agencies. Expenditures for activities of Local Health Departments (LHDs) are included only to the extent that they represent the State Health Agency grants to LHDs.

Not all SHAs perform the same services. In some states certain services are performed by other state agencies. For example, expenditures for mental health services may be controlled by a separate Mental Health Agency.

The public health programs of SHAs can be divided into four program areas, apart from general administrative and service functions: personal health, environmental health, health resources and laboratory services.

Nearly 72% of SHA expenditures in 1979 were for personal health in nine areas: general and supporting personal health, maternal and child health, communicable disease, handicapped children, dental health, chronic disease, mental health and related programs, SHA operated institutions, and other personal health (for instance, home health care and services to special population groups such as migrants).

There were some 3,100 local health departments in 1979. The territories and possessions (except Puerto Rico), three states and the District of Columbia do not have LHDs.

CHAPTER 5
Medical Care Costs

Each year Americans spend increasingly large amounts for medical care. The increases result from a combination of factors—higher costs, greater demand for health services, rising incomes, and growth and availability of private health insurance. Other major influences include the introduction of newer and costlier medical techniques and procedures, higher educational level of the population (which is generally associated with greater expenditures for personal health care), growing awareness of the availability of medical care, and a rising proportion of elderly persons in the population, who as a group are prone to a higher incidence of health-related problems.

Total Medical Expenditures

In this chapter, spending for health care is discussed in terms of the National Health Expenditure, the Personal Health Care Expenditure, Personal Consumption Expenditures for Medical Care, the Consumer Price Index, and the Family Budgets.

Total health care spending, represented by the **National Health Expenditure (NHE)** figure, includes both private and public expenditures for personal health care, medical research and construction of medical facilities, administrative and health insurance costs, and government-sponsored public health activities. Because of its all-inclusive nature, the National Health Expenditure will be discussed in terms of, and compared to, the Gross National Product. The National Health Expenditure figure covers spending for health care over the 12-month calendar year.

The **Personal Health Care Expenditure (PHCE)** figure represents private and public spending for health and medical services for the direct benefit of the individual, representing 89% of 1979 National Health Expenditures.

Included are expenditures for hospital care, physicians', dentists' and other professional services, drugs and drug sundries, eyeglasses and appliances, nursing home care, and spending for in-plant health services. Not included are expenditures for medical research, construction of medical facilities, public health activities such as disease prevention and control, and the net cost of health insurance — the difference between premiums and benefits paid. (The latter items are included in the National Health Expenditure figure.)

Personal Consumption Expenditures (PCE) for medical care represent private payments, although monies from three government programs (Medicare, Workers' Compensation and Temporary Disability Insurance) are treated as transfer payments and are included. The PCE is computed as an annual average.

While the same basic categories of expenditures comprise the PCE for medical care and the PHCE portion of the NHE figure, different accounting practices are used for each. Some important distinctions include:

(1) With respect to hospital costs, the PHCE figure focuses on personal outlays for hospital services and does not include the cost of providing services; the PCE includes the latter item for private, nonprofit hospitals.

(2) The PCE includes the net cost of health insurance (i.e., earned premiums less benefits paid) but the PHCE does not. However, this figure is included in the NHE data.

The Consumer Price Index (CPI) measures the average change in prices of all types of consumer goods and services purchased by urban wage earners and clerical workers. The index measures the effect of *price change only* on the cost of living. It does *not* measure changes in the total amount families spend.

Hypothetical **Family Budgets** are estimated annually by the U.S. Bureau of Labor Statistics for two types of families: the urban family of four and the retired couple. Each budget represents the costs of three hypothetical lists of good and services that were specified in the mid-1960s to portray three relative standards of living—described as lower, intermediate and higher. The budgets are for a precisely defined urban family of four and for a self-supporting urban retired couple.

The medical care component of the budget for a family of four includes family membership in a group hospital and surgical plan, a specified number of physician visits, eye and dental care and prescriptions (except that the higher budget also includes major medical insurance coverage). For the retired couple, the budget includes out-of-pocket expenses for Medicare and for items not covered by Medicare, including dental care, prescriptions and eyeglasses.

National Health Expenditures

National health spending reached $212.2 billion in 1979 (Table 5.1), or an average of $943 per person.

Total health expenditures showed a 12.5% increase, compared with an 11.0% increase in 1978. Public spending, which financed 43.1% of all health care costs in 1979, increased 13.3% over 1978, while private spending rose 11.9%. Since 1974, the last year price controls for health services were in effect, national health expenditures have risen 82.5%.

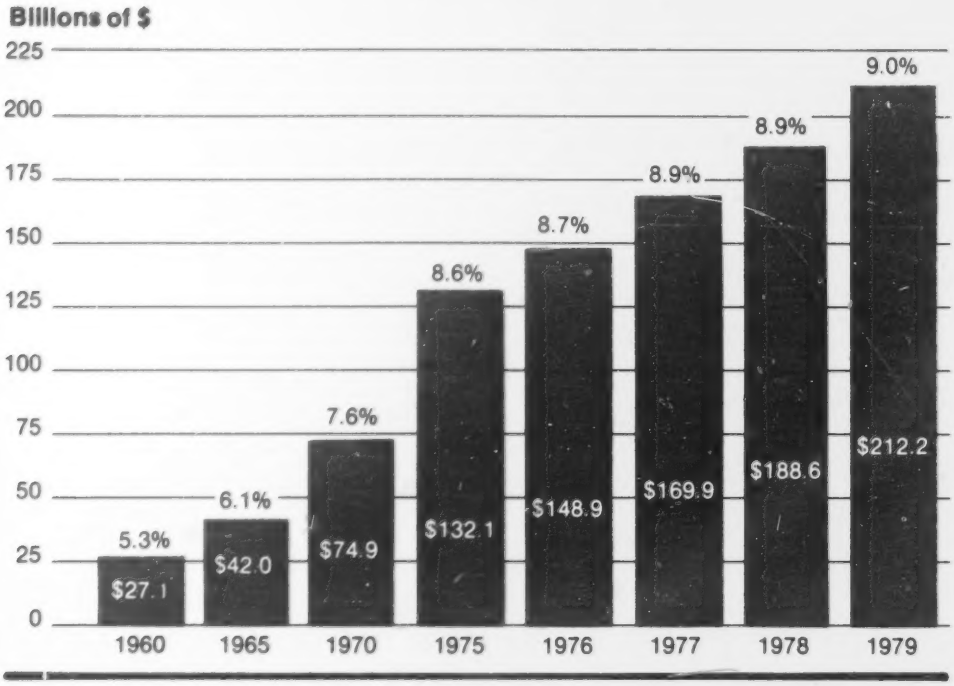
Hospital care continued to represent the largest share of spending for health care, totaling $85.3 billion in 1979. The cost of physicians' services was the next highest at $40.6 billion.

In 1965, National Health Expenditures comprised 6.2% of the Gross National Product. This proportion has continued to increase over the years, reaching a record of 9.0% in 1979. The annual growth rate of National Health Expenditures peaked at 14.1% in 1977. In 1978 the rate of growth in expenditures for health care fell to 11.0% but rose again in 1979, to 12.5%. The Gross National Product increased by 12.0% in 1978, and 11.3% in 1979.

According to projections made by the Health Care Financing Administration, National Health Expenditures will reach $245 billion in 1980, $438 billion in 1985 and $758 billion by 1990. Per capita expenditures are projected to be $1,846 in 1985, almost double the 1979 figure of $943. By 1990, per capita expenditures are projected to exceed $3,000 (Table 5.3).

Estimates from the Health Resources Administration (U.S. Department of Health and Human Services) predict that in the year 2000 the total

National Health Expenditures and Percent of Gross National Product



direct and indirect economic costs of illness will exceed $2 trillion (Table 5.4) and will comprise between 11% and 12% of the Gross National Product.

Personal Health Care Expenditures

Spending for personal health care in the nation amounted to $188.6 billion in 1979 (Table 5.6). This sum includes all outlays for health and medical services for the direct benefit of the individual, including both public and private spending.

According to an analysis of personal health care expenditures by the Health Care Financing Administration, the effect of inflation in 1980 returned to the 1977 level, after two consecutive years of decline (Table 5.5). For the twelve month period ending March 1977, price increases accounted for 73% of the expenditure growth while the increase in intensity of care — frequency and quality of care — contributed 20% to the overall growth rate. During the twelve month period ending March 1980, the effect of inflation accounted for 74% of the expenditure growth and the intensity of care for 19%.

An analysis of the $188.6 billion of national spending for personal health care (Table 5.7) shows the per capita expenditure rose to $838 in 1979. In 1978, persons age 65 and older accounted for 29.4% of total personal health care spending, while persons under age 19 and those between the ages of 19 and 64 accounted for 11.8% and 58.8%, respectively.

The largest portion of the personal health care dollar is financed by third-party sources (Table 5.8). Private health insurance, philanthropy, industry and the government paid 68% of all expenditures for personal

health care in 1979, compared to 65% in 1974.

Personal health care figures include expenditures of all consumers, whether insured or not. Included are expenses for non-prescribed drugs and medicines, household supplies such as tissues and rubbing alcohol, and other items not covered by insurance.

In terms of the growth of personal health care components, hospital care has been one of the fastest growing categories of expenditures. In 1965, monies spent for hospital care represented 39% of personal health care expenses. By 1979, the proportion rose to 45%. During the 1965-79 period, outlays for physicians' services dropped from 24% to 22% of personal health care spending.

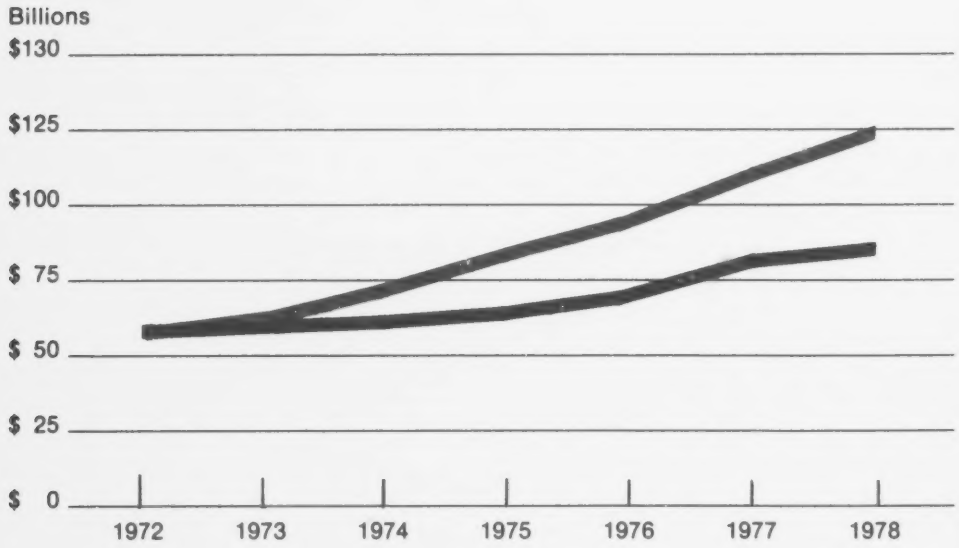
According to a report released by the Congressional Budget Office (Table 5.9), an estimated 2.5 million people, or 1.3% of the under age 65 population would incur medical expenses of $5,000 or more in fiscal 1978. The largest proportion of that age group, 73%, were predicted to have per capita expenses for medical care of less than $100.

Personal Consumption Expenditures

Personal Consumption Expenditures for medical care were over $128 billion for calendar year 1978 (Table 5.12), more than three times the amount spent 10 years earlier. The 1978 amount represented 9.5% of the total spent by Americans on all personal needs, compared with 7.1% a decade earlier.

As a proportion of the public's disposable personal income, these

Personal Consumption Expenditures for Medical Care in Current Dollars and Constant 1972 Dollars



SOURCE: U.S. Dept. of Commerce, Bureau of Economic Analysis, *Survey of Current Business*, July 1978.

expenditures were 8.8% in 1978, up from 6.4% in 1968 (Table 5.13).

Personal Consumption Expenditures for nongovernmental hospital care (including expenses of nonprofit hospitals, sanitariums and nursing homes, and payments by patients to proprietary hospitals, sanitariums and nursing homes) were more than $61.6 billion in 1979 (Table 5.14), more than four times the amount in 1969. Payments for physicians' services were $35.1 billion, more than three times the amount spent a decade earlier.

Consumer Price Index

According to the Consumer Price Index (CPI), in 1980, medical costs increased by 10.9% over 1979 compared to a 13.5% increase for all items. This was the second year in a row that the CPI for medical care did not outpace the increase for all goods and services (Table 5.16).

Individual components of medical care have differed in their rate of increase. Hospital room rates have risen most rapidly. The disproportionate rate of increase for hospital charges is due in no small part to the fact that the CPI index for hospital charges is based on the published charges, i.e., those charges made to patients insured by private insurance companies or to patients without any private or government coverage for hospital care costs. These charges are disproportionately higher than the actual per patient cost. The reason for this is that hospitals must make up revenues lost due to bad debts, charity cases, fixed reimbursement schedules under Medicare and Medicaid, and negotiated reimbursement levels of many community-rated health insurers. The resulting shortfall is shifted to insurance company patients or to those with no insurance coverage. To illustrate, data available from the American Hospital Association and the Health Care Financing Administration indicate that the lower payment differential for Medicare patients in community hospitals compared with payments for patients covered by insurance companies in 1977 varied from 15.3% in Oregon to 37.1% in Alabama.

The Consumer Price Index for 1979 and later years reflects the substantial revisions made in many categories of goods and services. Additionally, as of January 1978, the index was revised to include all urban consumers. In the past only urban wage and clerical workers were included. Thus, the newly created or revised categories should not be compared to prior years.

Family Budgets

The family budget is also used as a means of weighing various components of family consumption costs. Hypothetical budgets for autumn of each year are developed by the Bureau of Labor Statistics for an urban family of four and for a retired couple at the lower, intermediate and higher standards of living. The hypothetical data are presented in Tables 5.18-5.20.

Between autumn 1978 and autumn 1979, consumption costs for the four-person family rose 9.0% in the lower budget, 10.2% in the intermediate budget and 10.6% in the higher budget. Among the budget consumption components (which include food, housing, transportation,clothing, personal care and medical care), medical care registered the second largest increase in the three budgets.

Medical care costs increased an average of 9.5% for a retired couple in 1979.

Hospital and Nursing Home Charges

Community Hospital Statistics

The average cost to community hospitals to treat a person in 1979 was $248.60 per patient-day, a 95% increase over 1974. On a state-by-state basis, the average cost per day in 1979 varied considerably from a low of $167.90 in Montana to a high of $466.80 in Alaska.

In 1979, the average length of time a patient remained in a community hospital was 7.6 days compared to 7.8 days in 1974. In recent years there has been a steady decline in the average length of a hospital stay, because of more sophisticated medical techniques and increased numbers of persons convalescing at home.

Although the length of the average hospital stay declined over the five-year period, the cost for the average stay went up, climbing 90% to reach $1,889.40 per patient stay.

The average length of stay varied by area, from a low of 5.1 days in Wyoming to a high of 9.7 days in New York State. Differences reflect the incidence of various diseases, age distribution of the population, income levels and postponement of non-emergency admissions.

Operating costs of community hospitals increased to $66.0 billion in 1979, 102% more than the $32.6 billion in 1974, and 13% higher than in 1978.

The American Hospital Association reports that payrolls reached $32.6 billion, representing 49.4% of community hospital expenditures in 1979. The payroll as a proportion of expenditures has been steadily decreasing since 1962, when it was 61.9% of expenditures, while the proportion represented by the non-labor component has been rising.

Semiprivate Room Charges. A continuing survey conducted by the Health Insurance Association of America shows that as of July 1980, the national average daily cost to the patient for a semiprivate room was $134.49, a 5.2% increase over January 1980. Survey results are based on responses from 2,739 nongovernmental short-term general hospitals nationwide. The highest average rate was in the West, at $152.91 per day. The lowest average rate was in the South, at $107.33 per day.

Nursing Home Charges. A survey on nursing home charges conducted by the National Center for Health Statistics, discloses that the average monthly charge per resident amounted to $689 in 1977. The average charge for care in proprietary nursing homes was 10.3% less than in nonprofit homes and 4.3% less than in government facilities.

Geographically, the highest average monthly resident charge was in the Northeast ($918) while the South had the lowest ($585).

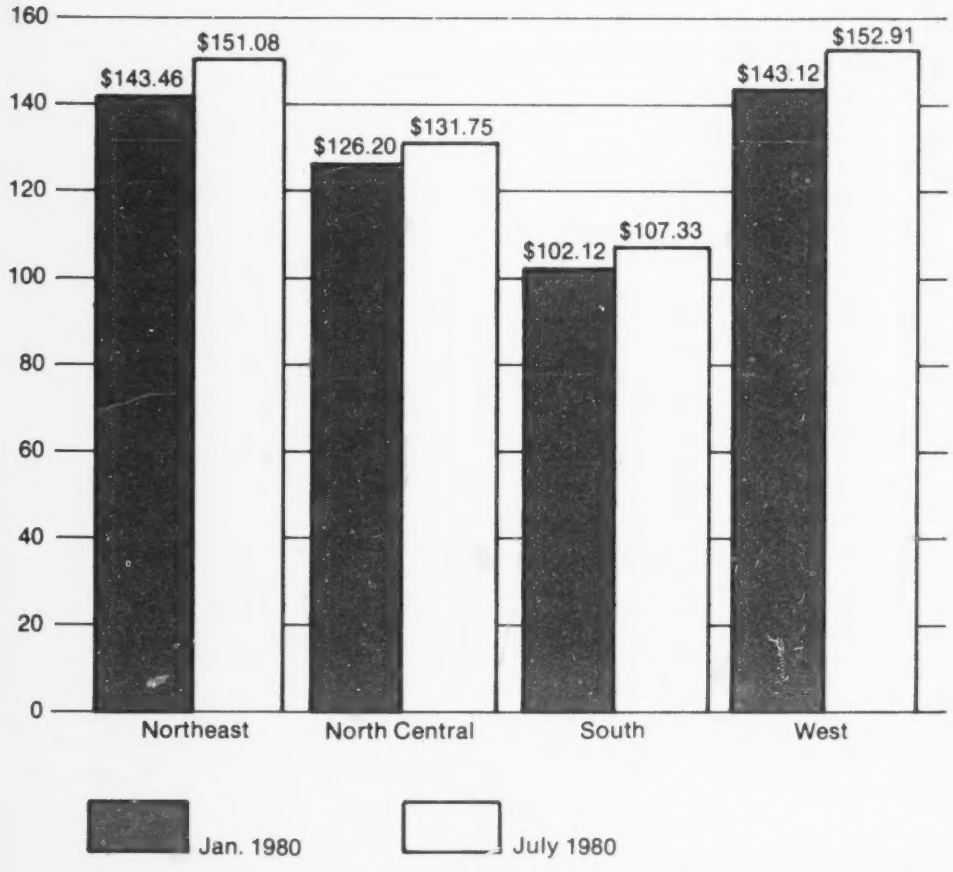
Average monthly charges increased with the size of the facility. Nursing homes having fewer than 50 beds charged an average of $546 per month while those with 200 beds or more averaged $837 per month.

Professional Fees

Surgical and Dental Charges.

Surgical charges vary considerably by geographic region and by metropolitan and nonmetropolitan areas. Table 5.24 containing data from a 1980 survey of insurance company claims conducted by the Health Insurance Association of America shows the variance of eight common surgical procedures in six

Average Cost to Patient Per Day for Semiprivate Hospital Room by Region



NOTE: Northeast includes New England and Middle Atlantic states; North Central, East North Central and West North Central states; South Atlantic, East South Central and West South Central states; and West, Mountain and Pacific states. Data exclude Puerto Rico.

SOURCES: Health Insurance Association of America, *Survey of Hospital Semiprivate Room Charges, July 1980.*

major metropolitan and six nonmetropolitan areas.

Results of a 1980 survey of average insurance company dental claims (Table 5.25), show less variation by geographic region.

Physician Fees. As tables 5.26 and 5.27 show, physician fees vary considerably by type of practice or speciality, type of visit and region of the United States. In 1980, the median charges for an initial office visit and an office revisit were highest for specialists and for physicians practicing in the Western states. In general, the median charges for all non-surgical specialties were higher than for surgical specialities.

Cost of Catastrophic Illness

Public concern over what has been popularly termed "catastrophic" health care costs has been steadily increasing in recent years.

A report issued by the National Center for Health Services Research (U.S. Department of Health and Human Services) describes how this country's catastrophic illness incidence, costs and financing appeared in 1974. (The study defined a "catastrophe" as medical expenses in excess of $5,000 in a calendar year.)

According to the report, over 2.5 million persons incurred catastrophic medical expense in 1974, totaling $21.94 billion. Thus, 1.2% of the nation accounted for 19% of the national expenditures for health care ($116.3 billion in 1974). The distribution of catastrophic illness varied widely across the population, as shown in Table 5.28.

The incidence of catastrophic types of illness was dominated by those in the institutionalized population. While the 1.3 million institutionalized individuals with catastrophic illnesses represented only .6% of the U.S. population, they accounted for 43% of total catastrophic expenditures.

The aged, noninstitutionalized population accounted for 23% of the entire catastrophic population and 29% of the total catastrophic bill. Three of 100 persons in this segment of the population incurred catastrophic levels of expense, a rate eight times that of noninstitutionalized persons under age 65.

Noninstitutionalized persons under 65 with incomes below $7,000 accounted for $2.05 billion and represented one-tenth of the catastrophic population.

Those with incomes equal to or greater than $7,000 accounted for a larger proportion of catastrophic expenses — $4.12 billion.

It was estimated that in 1974, 86% of catastrophic expenditures for noninstitutionalized persons were supported through public payments or third-party payers. Out-of-pocket payments accounted for the remaining 14%.

CHAPTER 6
Health and Health Care Utilization

Trends in Utilization of Services

Hospital Utilization.

Approximately one of six Americans (based on the civilian noninstitutional population) was admitted to a community hospital in 1979. Community hospitals, defined as nonfederal, short-term, general and special hospitals providing general medical care to the public, account for 84% of all hospitals and handle almost 93% of all admissions.

An average of 96,200 persons entered community hospitals each day during 1979 — 35,099,200 admissions over the 12-month period. This was a 24.2% increase over 1969.

On an average day in 1978, there were 727,334 patients in community hospitals, or 3.4 per 1,000 population. This rate has remained constant since 1974.

The nation's community hospitals treated 198.8 million outpatient cases in 1979. Outpatient utilization decreased by 3.1 million patients, following several years of rapid increase.

A National Center for Health Statistics survey of short-stay hospital utilization in 1978 reported the average length of stay was 7.8 days for males and 7.1 days for females. Length of stay increased with age from 4.4 days for children under 15, to 11.0 days for persons 65 and over. The Northeast registered the longest average length of stay, 8.8 days for all ages, while the Western region had the shortest, 6.1 days.

Physician and Dental Visits. According to estimates of the U.S. Department of Health and Human Services' *Health Interview Survey,* Americans made 1,021 million visits to physicians in 1979. The average number of visits per person was 4.7. (For definition, see Table 6.5.)

The survey also showed that Americans made 366 million visits to dentists in 1979. The average number of visits per person was 1.7. (For definition, see Table 6.5.) About 50% of the population had last visited a dentist within a year.

A government survey of ambulatory patient visits in 1977 (where there was contact with a physician) showed that the largest proportion of office visits, 39%, were made to general and family practitioners. About 4% of visits were for problems with an onset of less than 24 hours, indicating the nonemergency nature of most office visits. An estimated 22% of patient problems had an onset of less than one week and approximately 30% had an onset of three months or more. Visits to solo practitioners outnumbered those to physicians in multiple-member practices by a ratio of about 3 to 2. The proportion of visits to physicians' offices in metropolitan areas exceeded the proportion in nonmetropolitan areas by three to one.

Office visits per year increased in direct proportion to advancing age. Nearly 62% of all office visits by adults were made by women.

Diseases of the respiratory system accounted for nearly 15% of all visits and another 10% of visits were for

diseases of the circulatory system.

The following seven diagnostic groups accounted for about 75% of the principal diagnoses made by physicians in office practice.

	Percent
Special conditions and examinations without illness	16.8
Diseases of the respiratory system	14.5
Diseases of the circulatory system	9.6
Diseases of the nervous system	8.5
Accidents, poisoning and violence	7.7
Diseases of the genitourinary system	6.4
Diseases of the musculoskeletal system	5.8
Diseases of the skin and subcutaneous tissue	5.6

Health Status

Disability. Disability rates for both acute and chronic health conditions—as measured by work-loss days, restricted activity days and disability days—vary by social and economic characteristics.

Table 6.6 shows that the higher the educational attainment, the fewer days of disability. Marked differences in the number of disability days are also found in relation to income. The differentials in disability by occupation are not as marked—blue-collar workers averaged 6.2 work-loss days while white-collar workers averaged 4.2 work-loss days.

The disability rates also vary by geographic region. Among the four regions (Northeast, North Central, South and West), persons in the West had the highest level of restricted activity days, 21.8, and the highest frequency of physician visits, 5.1 per person per year. (For definition, see Table 6.7.)

Persons in the South registered the highest rates of bed-disability and work-loss days and had the lowest rate of dental visits, 1.4 per person per year.

Acute Conditions. Some 339 million workdays were lost in 1979 as a result of some acute health condition. (For definition, see footnote, Table 6.9.) This was an average of 3.5 days off the job for each worker in the nation.

During 1979, acute illnesses and injuries caused an average of 9.4 days of restricted activity per person and 4.1 bed-disability days per person. A rate of 4.8 school-loss days per child between the ages of 6 and 16 was reported for 1979. The incidence of acute conditions, shown in Table 6.10, decreased somewhat from 1978.

Chronic Conditions. Chronic illness invariably has a long-term impact on people, changing their lifestyles to the extent that they can no longer carry on their major activity, such as working or keeping house, or limiting the kind or duration of their activities. In 1979, 31.5 million persons, 14.6% of the U.S. civilian noninstitutional population, suffered a limitation of activity because of one or more chronic conditions (Table 6.12). Of that number, some 23.6 million suffered limitation of their major activity. Males at all ages experienced a higher incidence of activity limitation than females.

Occupational Injuries and Illness. According to the U.S. Department of Labor's latest survey, approximately 6.0 million workrelated injuries occurred in 1979, an increase of 5% over 1978. This increase, however, was nearly proportionate to the rise in the number of workers employed and their hours on the job. Therefore, the rate of injuries continued at virtually the same level in 1978 and 1979 (Table 6.13).

Some 42.6 million workdays were lost because of work-related injuries

in 1979—up from 38.2 million in 1978. The rate per 100 full-time workers increased from 62.1 lost workdays a year in 1978 to 66.2 in 1979.

Nearly 149,000 reported cases of occupational illnesses were recorded in 1979, compared with 143,500 in 1978.

According to a report by the Social Security Administration (Table 6.14), American workers suffered a $32.9 billion loss in earnings resulting from short-term, nonoccupational sickness or injury during calendar year 1978, an increase of 16.6% over the previous year.

Benefits paid under programs providing protection against income loss resulting from these disabilities amounted to $11.7 billion, an 11.2% increase over 1977.

Table 6.1
Utilization of Community Hospitals in the United States
(Per 1,000 Population)

Farm	10.1	2.1	4.5

NOTE: The data refer to the civilian, noninstitutional population. A "Restricted activity day" is one on which a person cuts down on his usual activities for the whole of that day because of an illness or injury. A "Bed disability day" is one on which a person stays in bed for all or most of the day because of a specific illness or injury. A "Work-loss day" is a day on which a currently employed person, 17 years of age and over, did not work at least half of his normal workday because of a specific illness or injury. "Family Income" includes the total income of each member of the family. "Educational Attainment" refers to the number of years of schooling the individual has received.

CHAPTER 7
Health Manpower

According to the Department of Labor some 5.0 million persons were active in the health field in 1979, 2.0 million more than in 1970.

Physicians

According to the American Medical Association's latest available figures, there were 401,364 active physicians in the United States and possessions at year-end 1978, including 20,242 physicians employed by the Federal government. Some 91.6% of all active non-Federal physicians were involved in direct care of their patients while the remainder were engaged in administration, research, teaching and other activities. Of those in patient care, 73.3% had office-based practices and 26.7% had hospital-based practices. Some 9.9% of physicians were women.

According to Table 7.3, in 1978, the District of Columbia had the highest ratio of non-Federal physicians to population, followed by New York, Massachusetts, Maryland and Connecticut. The lowest ratios of physicians to population occurred in South Dakota, Mississippi, Wyoming and Idaho.

Dentists

In 1978, the number of active dentists reached an estimated 117,223, including 6,214 dentists employed by the Federal government. According to the latest available data (Table 7.3), the District of Columbia, Washington, Connecticut, New York, and Oregon had the highest ratios of dentists to population while Mississippi, Arkansas Alabama, and West Virginia had the lowest ratios. Table 7.1 shows that nearly two-thirds of the dental work force in 1978 comprised auxiliary personnel (dental hygienists, assistants and laboratory technicians).

Nurses

Between 1949 and 1977, the number of registered nurses employed in nursing tripled to reach an estimated 1,027,307. According to the 1977-78 Registered Nurse Inventory, it is estimated that the New England states have the highest ratio of employed registered nurses per 100,000 population. The East South Central and West South Central states have the lowest. The data, while excluding inactive nurses, include those employed in nursing on a part-time basis. In 1977, 30% of employed registered nurses worked on a part-time basis.

In 1977, 2.4% of employed registered nurses were male, compared with 1.1% in 1966. The number of licensed practical nurses has also increased in recent years. In 1978, there were 518,000 practical nurses employed in nursing. Licensed practical nurses provide personal care to patients, including 70% of the personal care given to elderly patients.

Pharmacists

In 1978, there were 136,670 active pharmacists in the United States. The ratio of pharmacists to the population rose from 53 per 100,000

persons in 1970 to 63 in 1978.

At the beginning of 1975, about 74% of active pharmacists practiced privately in community pharmacies, and some 18% practiced full- or part-time in hospitals. Other pharmacists were employed by manufacturers, taught or were engaged in other pharmaceutical activities such as research. Of resident pharmacists in the United States, 11% were women.

Table 7.1
Estimated Number of Persons Active In Selected Health Occupations, 1978

Occupation	Number of Persons Active
Clinical Laboratory Services	242,100
Dentistry and Allied Services	351,150

Appendix I

Historic Dates

1850 Individual accident insurance became available in the United States with the chartering of the Franklin Health Assurance Company in Massachusetts.

1851 One of the earliest voluntary mutual protection associations, *La Societe Francaise de Bienfaisance Mutuelle*, was organized in San Francisco. It is noteworthy for having established a hospital in 1852 to provide care for its members.

1863 The Travelers Insurance Company of Hartford, Connecticut, offered individual accident insurance on a basis that closely resembles its present form.

1866 By this time more than 60 insurers were actively operating in the accident insurance field.

1875 A number of mutual benefit associations, called "establishment funds," were formed for employees of a single employer. The benefits provided usually included small payments for death and disability.

1890s This period brought the promotion of many fraternal associations, assessment mutuals and industrial insurers. Because many of these companies and associations were inadequately financed and poorly managed, many states passed legislation against them.

1910 Montgomery Ward & Co., Inc. replaced its "employee establishment fund" with an insured contract. This plan is generally regarded as the first group health insurance policy.

1912 The Standard Provisions Law drafted by the National Convention of Insurance Commissioners (now the NAIC) was enacted by most states. This model law sought to provide uniformity and fairness in the "operating conditions" of the health insurance contract.

1917 Group accidental death and dismemberment insurance was first written.

1920s Early in this decade individual hospitals began offering hospital expense benefits on an individual prepaid basis.

1929 A group of school teachers arranged for Baylor Hospital in Dallas, Texas to provide room and board and specified ancillary services at a predetermined monthly cost. This plan is considered the forerunner of what later became known as the Blue Cross plans.

1929 The first health maintenance organization, the Ross-Loos Clinic, was established in Los Angeles, California.

1930s The depression stimulated the expansion of insurance coverages through both pub-

lic demand and hospitals' encouragement.

1935 The Social Security Act (P.L. 74-241) provided for the first time grant-in-aid to states for such public health activities as maternal and child care, aid to crippled children, blind persons, the aged and other health-impaired persons.

1938 Private insurers introduced group surgical expense benefit plans.

1939 The first Blue Shield plan (surgical-medical), called the California Physicians' Service, was developed.

1940s During World War II, as a result of the freezing of wages, group health insurance became an important component of collective bargaining for employee benefits.

1942 Compulsory cash sickness benefits were begun by four states (Rhode Island, 1942; California, 1946; New Jersey, 1948; New York, 1949).

1943 Private insurers introduced group medical expense benefits (Physician's Visits Expense Benefits).

1948 The National Labor Relations Board ruled, in a dispute between the United Steelworkers' Union and the Inland Steel Company, that the term "wages" be construed to include pension and insurance benefits. The U.S. Supreme Court upheld this ruling in a 1949 decision.

1949 Major medical expense benefits were introduced by Liberty Mutual Insurance Company to supplement basic medical care expenses.

1957 Vision care expense benefits were introduced by private insurers, followed in 1959 by extended care facility expense benefits.

1963 The Health Professions Educational Assistance Act (P.L. 88-129) aided training of physicians, dentists and other public health personnel.

1964 Prescription drug expense benefits were introduced.

1964 The Nurse Training Act (P.L. 88-581) provided special Federal effort for training professional nursing personnel.

1965 Social Security Amendments of 1965 (P.L. 89-97) established a Social Security hospital insurance program for the aged and voluntary supplementary medical insurance program (Medicare) and grants to states for medical assistance programs (Medicaid).

1971 The Insurance Medical Scientist Scholarship Fund was formed by several insurance companies, providing full scholarships for students planning careers in medical research and teaching.

1972 Social Security Amendments of 1972 (P.L. 92-603) extended health insurance benefits (Medicare) to the disabled and to end-stage renal disease patients; established Professional Standards Review Organization (PSRO) programs; and expanded research and demonstrations of financing mechanisms.

1973 The Health Maintenance Organization Act (P.L. 93-222) assisted in the establishment and expansion of HMOs.

1975 The National Health Planning and Resources Development Act of 1974 (P.L. 93-641)

authorized major Federal reorganization of health planning programs and set up the national designation of local Health Systems Areas and governing agencies.

1976 The National Consumer Health Information and Health Promotion Act of 1976 (P.L. 94-317) set forth national goals for health information and promotion and a systematic strategy for their achievement — stressing health education.

1976 The Health Maintenance Organization Amendments of 1976 (P.L. 94-460) relaxed requirements for HMOs to qualify for Federal support.

1976 The Health Professions Educational Assistance Act of 1976 (P.L. 94-484) contained provisions requiring medical school students who receive federal scholarship aid to serve a specified period in rural and inner-city areas, and required that medical schools with teaching hospitals provide for a greater proportion of medical residencies in primary medicine.

1977 The Medicare-Medicaid Anti-Fraud and Abuse Amendments (P.L. 95-142) amended the Social Security Act to require uniform reporting of financial data by providers; upgraded criminal penalties for fraud under Medicare-Medicaid programs; and amended certain Professional Standards Review Organization (PSRO) provisions.

1978 The Health Maintenance Organization Amendments of 1978 (P.L. 95-559) set forth a three-year extension of the HMO assistance program.

Glossary

Accident an event or occurrence which is unforeseen and unintended.

Accidental Bodily Injury injury to the body as a result of an accident.

Accidental Means the unexpected and unforeseen cause of an accident. The "means" which caused the mishap must be accidental in order to claim benefits under the policy.

Accumulation Period a specified period of time, such as 90 days, during which the insured person must incur eligible medical expenses at least equal to the deductible amount in order to establish a benefit period under a major medical expense or comprehensive medical expense policy.

Acquisition Cost the immediate cost of issuing a new policy, including cost of clerical work, agent's commission and medical inspection fees.

Actuary a technical expert trained in the insurance field who is reponsible for calculating premium rates, reserves and dividends, as well as conducting various other statistical studies.

Administrative Service Only (ASO) Plan an arrangement under which an insurance carrier or an independent organization will, for a fee, handle the claims and benefits paperwork for a self-insured group and insure against a certain level of large unpredictable claims.

Adverse Selection the tendency of persons with poorer than average health expectations to apply for or continue insurance to a greater extent than do persons with average or better health expectations.

Age Limits stipulated minimum and maximum ages below and above which the company will not accept applications or may not renew policies.

Agent an insurance company representative licensed by the state who solicits, negotiates, or effects contracts of insurance, and services the policyholder for the insurer.

Aggregate Indemnity the maximum dollar amount which may be collected for any disability, period of disability, or under the policy.

Allocated Benefits benefits for which the maximum amount payable for specific services is itemized in the contract.

Application a signed statement of facts requested by the company on the basis of which the company decides whether or not to issue a policy. This then becomes part of the health insurance contract if the policy is issued.

Assignment the signed transfer of the benefits of a policy by the owner of the policy to a third party.

Association Group a group formed from members of a trade or professional association for group insurance under one master health insurance contract.

Aviation Trip Insurance a policy type protecting individuals as passengers of scheduled aircraft. It is generally obtained at airports.

Beneficiary a person or persons designated by the policyholder to receive a specified cash payment upon the policyholder's death.

Binding Receipt a receipt given for a premium payment accompanying the application for insurance. If the policy is approved, this binds the company to make the policy effective from the date of the receipt.

Blanket Contract a contract of health insurance affording benefits, such as accidental death and dismemberment, for all of a class of persons not individually identified. It is used for such groups as athletic teams, campers, travel policy for employees, etc.

Blanket Medical Expense a provision which entitles the insured person to collect up to a maximum established in the policy for all hospital and medical expenses incurred, without any limitations on individual types of medical expenses.

Blue Cross an independent, nonprofit membership corporation providing protection against the costs of hospital care.

Blue Shield an independent, nonprofit membership corporation providing protection against the costs of surgery and other items of medical care.

Broker an insurance solicitor, licensed by the state, who places business with a variety of insurance companies and who represents the buyers of insurance rather than the companies even though he is paid commissions by the companies.

Business Insurance a policy which primarily provides coverage of benefits to a business as contrasted to an individual. It is issued to indemnify a business for the loss of services of a key employee or a partner who becomes disabled.

Capital Sum the maximum amount payable in one sum in event of accidental dismemberment. When a contract provides benefits for kinds of dismemberment, each benefit is an amount equal to, or a fraction of, the capital sum.

Certificate of Insurance a document delivered to the insured person which summarizes the benefits and principal provisions of the group plan.

Claim a demand to the insurer by the insured person for the payment of benefits under a policy.

Coinsurance a policy provision frequently found in major medical insurance, by which both the insured person and the insurer share in a specified ratio the covered losses under a policy.

Comprehensive Major Medical Insurance a policy designed to give the protection offered by both a basic and a major medical health insurance policy. It is characterized by a low deductible amount, a coinsurance feature, and high maximum benefits.

Confining Sickness an illness which confines an insured person to his or her home or to a hospital.

Consideration one of the elements of a binding contract. Consideration is acceptance by the insurance company of the payment of the premium and the statement made by the prospective policyholder in the application.

Conversion Privilege the right given to an insured person to convert to individual insurance without evidence of medical insurability, usually upon termination of coverage under a group contract.

Coordination of Benefits (C.O.B.) a method of integrating benefits payable under more than one group health insurance plan so that the insured person's benefits from all sources do not exceed 100% of allowable medical expenses.

Deductible the amount of covered expenses which must be incurred by the insured person before benefits become payable by the insurer.

Disability a condition which renders a person incapable of performing one or more duties of his or her regular occupation.

Disability Income Insurance a form of health insurance that provides periodic payments to replace income when the insured person is unable to work as a result of illness, injury or disease.

Dismemberment the loss of a limb or sight.

Double Indemnity a policy provision usually associated with death, which doubles payment of designated benefits when certain kinds of accidents occur.

Dread Disease Insurance insurance providing an unallocated benefit, subject to a maximum amount, for expenses incurred in connection with the treatment of specified diseases, such as cancer, poliomyelitis, encephalitis and spinal meningitis.

Earned Premium that portion of a policy's premium payment for which the protection of the policy has already been given. For example, an insurance company is considered to have earned 75% of an annual premium after a period of nine months of an annual term has elapsed.

Elective Benefit a benefit payable in lieu of another; e.g., a lump sum benefit may be allowed for specified fractures or dislocations in lieu of weekly or monthly indemnity.

Evidence of Insurability any statement or proof of a person's physical condition and/or other factual information affecting his or her acceptance for insurance.

Exclusions specific hazards or conditions listed in the policy for which the policy will not provide benefit payments.

Experience Rating variation of the premium rate, computed on the basis of past losses and expenses incurred by the insurance company in the settlement of claims and other expenses involving a particular group of risks.

Experience Refund a provision in most group policies for the return of premium to the policyholder because of lower than anticipated claims.

Family Expense Policy a policy which insures both the policyholder and his or her immediate dependents (usually spouse and children).

Franchise Insurance a form of insurance in which individual policies are issued to the employees of a common employer or the members of an association under an arrangement by which the employer or association agrees to collect the premiums and remit them to the insurer.

Fraternal Insurance a cooperative type of insurance provided by social organizations for their members.

Geographic divisions (in the United States)

West South Central: Arkansas, Louisiana, Oklahoma, Texas

WEST
Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming
Pacific: Alaska, California, Hawaii, Oregon, Washington.

Grace Period a specified period after a premium payment is due, in which the policyholder may make such payment, and during which the protection of the policy continues.

Group Contract a contract of insurance made with an employer or other entity that covers a group of persons identified as individuals by reference to their relationship to the entity.

Guaranteed Renewable Contract a contract that the insured person has the right to continue in force by the timely payment of premiums for a substantial period of time, during which period the insurer has no right to make unilaterally any change in any provision of the contract, while the contract is in force, other than a change in the premium rate for classes of policyholders.

Health Insurance a generic term applying to all types of insurance indemnifying or reimbursing for costs of hospital and medical care or lost income arising from an illness or injury. Sometimes it is called Accident and Health Insurance, Accident or Sickness Insurance, or Disability Insurance.

Health Maintenance Organization (HMO) an organization that provides a wide range of comprehensive health care services for a specified group at a fixed periodic payment. The HMO can be sponsored by the government, medical schools, hospitals, employers, labor unions, consumer groups, insurance companies, and hospital-medical plans.

Hospital Benefits benefits provided under a policy for hospital charges incurred by an insured person because of an illness or injury.

Hospital Expense Insurance health insurance protection against the costs of hospital care resulting from the illness or injury of an insured person.

Hospital Indemnity a form of health insurance which provides a stipulated daily, weekly or monthly indemnity during hospital confinement. The indemnity is payable on an unallocated basis without regard to the actual expense of hospital confinement.

Hospital-Medical Insurance a term used to indicate protection which provides benefits toward the cost of any or all of the numerous health care services normally covered under various health insurance plans.

Incontestable Clause an optional clause which may be used in noncancellable or guaranteed renewable health insurance contracts providing that the insurer may not contest the validity of the contract after it has been in force for two (sometimes three) years.

Indemnity benefits paid in a predetermined amount in the event of a covered loss.

Individual Insurance policies which provide protection to the policyholder and/or his or her family (as distinct from group and blanket insurance). Sometimes called Personal Insurance.

Injury Independent of All Other Means an injury resulting from an accident, provided that the accident was not caused by an illness.

Insurance protection by written contract against the financial hazards (in whole or in part) of the happenings of specified fortuitous events.

Insurance Company any corporation primarily engaged in the business of furnishing insurance protection to the public.

Insuring Clause the clause which sets forth the type of loss being covered by the policy and the parties to the insurance contract.

Key-Man or Key-Person Health Insurance an individual or group insurance policy designed to protect an essential employee or employees of a firm against the loss of income resulting from disability. If desired, it may be written for the benefit of the employer, who usually continues to pay the salary during periods of disability.

Lapse termination of a policy upon the policyholder's failure to pay the premium within the time required.

Level Premium a premium which remains unchanged throughout the life of a policy.

Lifetime Disability Benefit a payment to help replace income lost by an insured person as long as he or she is totally disabled, even for a lifetime.

Limited Policies contracts which cover only certain specified diseases or accidents.

Long-Term Disability Income Insurance a provision to pay benefits to a covered disabled person as long as he or she remains disabled up to a specified period exceeding two years.

Loss-of-Income Benefits payments made to an insured person to help replace income lost through inability to work because of an insured disability.

Major Medical Expense Insurance health insurance to finance the expense of major illness and injuries. Characterized by large benefit maximums ranging up to $250,000 or no limit, the insurance, above an initial deductible, reimburses the major part of all charges for hospital, doctor, private nurses, medical appliances, prescribed out-of-hospital treatment, drugs and medicines. The insured person as coinsurer pays the remainder.

Medicaid state programs of public assistance to persons regardless of age whose income and resources are insufficient to pay for health care. Title 19 of the Federal Social Security Act provides matching Federal funds for financing state Medicaid programs, effective January 1, 1966.

Medicare the hospital insurance system and the supplementary medical insurance for the aged created by the 1965 Amendments to the Social Security Act and operated under the provisions of the Act.

Miscellaneous Expenses expenses in connection with hospital insurance, hospital charges other than room-and-board, such as X-rays, drugs, laboratory fees and other ancillary charges.

Morbidity the incidence and severity of sicknesses and accidents in a well-defined class or classes of persons.

Noncancellable or Noncancellable and Guaranteed Renewable Policy a policy which the insured person has the right to continue in force to a specified age, such as to age 65, by the timely payment of premiums. During the specified period the insurer has no right to unilaterally make any change in any provision of the policy while it is in force.

Nonconfining Sickness an illness which prevents the insured person from working but which does not confine him to a hospital or to his home.

Nondisabling Injury an injury which may require medical care, but does not result in loss of working time or income.

Nonoccupational Policy a contract which insures a person against off-the-job accident or sickness. It does not cover disability resulting from injury or sickness covered by Workers' Compensation. Group accident and sickness policies are frequently nonoccupational.

Nonprofit Insurers persons organized under special state laws to provide hospital, medical or dental insurance on a nonprofit basis. The laws exempt them from certain types of taxes.

Optionally Renewable Contract a contract of health insurance in which the insurer reserves the right to terminate the coverage at any anniversary or, in some cases, at any premium due date, but does not have the right to terminate coverage between such dates.

Overhead Insurance a type of short-term disability income contract that reimburses the insured person for specified, fixed, monthly expenses, normal and customary, in the operation and conduct of his business or office.

Partial Disability an illness or injury which prevents an insured person from performing one or more of the functions of his regular job.

Physician's Expense Insurance coverage which provides benefits toward the cost of such services as doctor's fees for nonsurgical care in the hospital, at home or in a physician's office, and X-rays or laboratory tests performed outside of the hospital. (Also called Regular Medical Expense Insurance).

Policy Term that period for which an insurance policy provides coverage.

Pre-Existing Condition a physical and/or mental condition of an insured person which existed prior to the issuance of his policy.

Premium the periodic payment required to keep a policy in force.

Prepaid Group Practice Plan a plan under which specified health services are rendered by participating physicians to an enrolled group of persons, with fixed periodic payment in advance made by or on behalf of each person or family. If a health insurance carrier is involved, it contracts to pay in advance for the full range of health services to which the insured is entitled under the terms of the health insurance contract. Such a plan is one form of a Health Maintenance Organization (HMO).

Principal Sum the amount payable in one sum in event of accidental death and, in some cases, accidental dismemberment.

Probationary Period a specified number of days after the date of the issuance of a policy during which coverage is not afforded for sickness. The purpose of the period is to eliminate coverage for sickness actually contracted before the policy went into effect.

Professional Standards Review Organization (PSRO) an organization in which practicing physicians assume responsibility for reviewing the propriety and quality of health care services provided under Medicare and Medicaid.

Proration the adjustment of benefits paid because of a mistake in the amount of the premiums paid or the existence of other insurance covering the same accident or disability.

Qualified Impairment Insurance a form of substandard or special class insurance that restricts benefits for the insured person's particular condition.

Recurring Clause a provision in some health insurance policies which specifies a

period of time during which the recurrence of a condition is considered a continuation of a prior period of disability or hospital confinement.

Regular Medical Expense Insurance (See Physician's Expense Insurance).

Reinstatement the resumption of coverage under a policy which has lapsed.

Renewal continuance of coverage under a policy beyond its original term by the acceptance by the insurer of a premium for a new policy term.

Reserve a sum set aside by an insurance company to assure the fulfillment of commitments for future claims.

Rider a legal document which modifies the protection of a policy, either expanding or decreasing its benefits or adding or excluding certain conditions from the policy's coverage

Risk any chance of loss.

Risk (impaired or substandard) an insurance applicant whose physical condition does not meet the physical standards for normal health.

Senior Citizen Policies contracts insuring persons 65 years of age or over. In most cases these policies supplement the coverage afforded by the government under the Medicare program.

Service Benefit an insurance benefit which fully pays the specific hospital or medical care services rendered.

Short-Term Disability Income Insurance a provision to pay benefits to a covered disabled person as long as he or she remains disabled up to a specified period not exceeding two years.

Special Class Insurance insurance for applicants of health insurance who cannot qualify for a standard policy by reason of impaired health.

Special Risk Insurance coverage for risks or hazards of a special or unusual nature.

Substandard Health Insurance an individual policy issued to a person who cannot meet the normal health requirements of a standard health insurance policy. Protection is given in consideration of an increase in premium or through a waiver of medical condition, or under a special qualified impairment policy.

Surgical Expense Insurance health insurance policies which provide benefits toward the physician's or surgeon's operating fees. Benefits may consist of scheduled amounts for each surgical procedure.

Surgical Schedule a list of cash allowances attached to the policy, which are payable for various types of surgery with the maximum amounts based upon the severity of the operations.

Time Limit the period of time during which a notice of claim or proof of a loss must be filed.

Total Disability an illness or injury which prevents an insured person from continuously performing every duty pertaining to his or her occupation or from engaging in any other type of work for remuneration. (This wording varies among insurance companies.)

Travel Accident Policy a limited contract covering only accidents while an insured person is traveling, usually on a commercial carrier.

Unallocated Benefit a policy provision providing reimbursement up to a maximum amount for the costs of all extra miscellaneous hospital services, but not specifying how much will be paid for each type of service.

Underwriting the process by which an insurer determines whether or not and on what basis it will accept an appiication for insurance.

Unearned premium that portion of a premium for which the protection of the policy has not as yet been given.

Waiting Period the duration of time between the beginning of an insured person's disability and the start of the policy's benefits.

Waiver an agreement attached to a policy which exempts from coverage certain disabilities or injuries which are normally covered by the policy.

Waiver of Premium a provision included in some policies which exempts the insured person from paying premiums while he is disabled during the life of the contract.

Written Premiums the entire amount of premiums due in a year for all policies issued by an insurance company.
